## ABSTRACT

An unlatching structure adopted for used on interface cards to release the latching relationship between an interface card and a server case includes an elastic slice and a pulling lever. The elastic slice is located on one side of the interface card and juts out from the surface of the interface card for latching onto the server case. The pulling lever is pivotally engaged with the interface card corresponding to the elastic slice. Moving the pulling lever drives the elastic slice close to the surface of the interface to unlatch the elastic slice from the server case.
